

# Chevron Lummus Global's environmental vision

Whether they are big steps or small steps, every step we make towards a cleaner, greener, more sustainable world is a step in the right direction.

Chevron took its first big step more than 50 years ago when it introduced ISOCRACKING technology – the first hydroprocessing technology available for upgrading difficult feeds into high value transportation fuels. Since then we have led the industry in developing hydroprocessing technologies and catalysts that help refiners achieve the cleanest products possible from any given feed.

Partnering with our customers and suppliers to improve the quality of fuels and lubricants around the world, we have designed thousands of projects in 70+ countries.

Working together we can help protect the environment around us and make the future more secure for the generations of today and tomorrow.
