

Decision Support Center

Voiceover

The D&C DSC is a combination of technology, processes and people designed to help eliminate serious well-control incidents and improve operational efficiency.

The DSC will support performance improvement in multi-well operations and process safety in wells that have been classified complex according to Chevron's global standards.

Let's see how the DSC works for our complex wells.

Underneath everything is a common data foundation infrastructure that allows the team in the DSC to access and view the same real-time data as the team members in the business unit and on the rig.

And the latest visualization and collaboration technologies enable the DSC team to interact as a virtual extension of our rig and business unit-based teams.

The people in the DSC are highly experienced Chevron D&C professionals who have a commitment to the Clear Leader vision and an interest in finding new ways to work together.

The DSC team will partner with the execution teams on a 24/7 basis to ensure D&C operations remain within the basis of design, support data-driven decisions by comparing real-time data to business unit models, and identify positive and possible kick indicators.
