

Committed to Process Safety

Natalie Martin, Health, Environment & Safety Specialist, Process Safety, Chevron

The last great unknown is deep sea. It's like a totally different world. It's the adventurous part of me that always wanted to go offshore.

Everyone focuses on personal safety, and that's very important. That's the everyday individual risk that we face. But process safety is looking at the entire rig population.

Personal Safety & Health: Eliminating personal safety and health hazards to prevent or mitigate injuries, illness and fatalities.

Process Safety: Designing, building, operating and maintaining facilities to prevent unplanned or uncontrolled release of material from primary containment.

In addition to training our people well, process safety is looking at our equipment and our facilities to make sure that we are maintaining our equipment, making sure that our design when we build our equipment and run our equipment is the most leading-edge for technology. It's very exciting, and it's a different way to look at safety.

The more time we spend on safety in the beginning, proactively, the less time we have to spend in response to an incident and have a potential injury.
